RESEARCH INTEREST

My research interests lie at the intersection of mathematics and cryptography. My past work has involved the application of combinatorial graph theory to analyze the (post-quantum) security of Memory-Hard Functions and Proofs of Sequential Work. I have also worked on analyzing the preprocessing security of cryptographic primitives in multiple idealized models, including short Schnorr signatures and Key Encapsulation Mechanisms. Recently, I have developed a deep interest in isogeny-based cryptography, drawing me toward its rich number-theoretic and algebraic foundations and its promising role in post-quantum cryptographic protocols.
